

Zomato Restaurant Data Analysis Report

Prepared by: Data Analysis Team
Dataset: Zomato Restaurant Listings – Bengaluru
Year: 2024

Business Problem

In recent years, food-tech platforms have witnessed an explosive growth in restaurant listings and user engagement. Zomato, one of India's leading restaurant discovery and food delivery platforms, has accumulated vast amounts of data on restaurants across Bengaluru. While the platform benefits restaurants by offering digital visibility, many challenges remain — including uneven distribution of online ordering facilities, inconsistent table-booking adoption, wide cost disparities, and varying levels of customer satisfaction across locations and cuisines.

The main objective of this analysis is to extract meaningful insights from the Zomato dataset to help restaurant owners, investors, and the platform itself make data-driven decisions. Specifically, the analysis focuses on factors that influence restaurant ratings, the relationship between online ordering / table booking and customer satisfaction, location-wise performance, and cuisine-level popularity.

[Figure 1: Zomato Platform Overview / Sample Dashboard]

Figure 1: Overview of Zomato platform data scope

Assumptions

1. The dataset accurately represents restaurant listings on Zomato in Bengaluru and is current enough for meaningful trend analysis.
2. Restaurant types with fewer than 1,000 entries and locations with fewer than 300 entries are grouped as 'Others' to reduce noise in the analysis.
3. Cuisine categories with fewer than 100 occurrences are consolidated under 'Others' for a cleaner distribution.
4. The 'Cost2plates' column represents the approximate cost for two people dining, which serves as a reliable proxy for restaurant price range.
5. Ratings labelled as 'NEW' or '-' are treated as missing values and are imputed with the column mean.
6. Votes (total reviews) are used as a proxy for restaurant popularity and customer engagement.

Research Questions

7. Which locations in Bengaluru have the highest concentration of restaurants and online ordering availability?
8. Does offering online ordering or table booking lead to higher customer ratings?
9. What is the relationship between restaurant type, location, and customer rating?
10. Which cuisines attract the most votes (customer engagement), and what does this tell us about food preferences?
11. How can restaurant owners and the Zomato platform improve service adoption and customer satisfaction?

Hypothesis

12. Restaurants that offer online ordering will have higher average ratings than those that do not, as convenience drives positive customer experiences.
13. Table-booking facilities correlate with higher ratings, as restaurants offering reservations tend to be of higher quality.
14. Locations such as BTM, Koramangala, and Indiranagar will show the highest restaurant density and engagement.
15. North Indian and South Indian cuisines will attract the most votes owing to their widespread popularity in Bengaluru.

Analysis and Findings

1. Online Order Availability by Location

The histogram below illustrates the distribution of restaurants offering online ordering across different Bengaluru locations. A clear disparity exists — central and popular neighbourhoods like BTM Layout, Koramangala, and HSR Layout have a significantly higher proportion of restaurants with online ordering enabled, while peripheral locations show lower adoption.

Figure 2: Online Order Availability distribution across Bengaluru locations

2. Online Order Count

The overall breakdown shows that a majority of Zomato-listed restaurants in Bengaluru do offer online ordering, reflecting the platform's push towards digitization and the growing consumer preference for food delivery. Restaurants without online ordering are typically dine-in focused establishments or smaller, niche outlets.

Figure 3: Count of restaurants with and without online ordering

3. Table Booking Availability

Table booking remains an underutilised feature. The majority of restaurants listed on Zomato do not offer table reservations. This is particularly notable for mid-range restaurants, which could benefit from table management to reduce walk-in wait times and improve the overall dining experience.

Figure 4: Proportion of restaurants offering table booking

4. Ratings vs. Online Order

The box plot comparing ratings across online-order enabled and non-enabled restaurants reveals that restaurants offering online ordering generally have a slightly higher median rating. This supports the hypothesis that digital convenience positively influences customer perception and satisfaction scores.

Figure 5: Rating distribution — online order vs. no online order

5. Ratings vs. Table Booking

Restaurants that offer table booking show a noticeably higher median rating compared to those that do not. This likely reflects the fact that table-booking facilities are more common in premium or well-established restaurants, which also tend to invest more in food quality and service standards.

Figure 6: Rating distribution — table booking vs. no table booking

6. Restaurant Type vs. Rating

The analysis of restaurant type (Buffet, Cafes, Delivery, Desserts, Dine-out, Drinks & Nightlife, Pubs & Bars) against ratings shows that Buffet-style restaurants and Cafes tend to attract higher ratings, while purely delivery-focused outlets score lower on average. Dine-out restaurants form the largest segment and display a wide rating spread.

Figure 7: Rating distribution across different restaurant types

7. Restaurant Count by Location and Type

Grouping restaurants by location and type reveals that Dine-out is the most common format across all neighbourhoods. Delivery and Cafes are concentrated in tech hubs and student-heavy areas. Pubs & Bars are prominent in Koramangala and Church Street, reflecting lifestyle-oriented neighbourhoods.

Figure 8: Distribution of restaurant types across Bengaluru locations

8. Votes by Location

Total votes (customer engagement) are highest in established food destinations like Koramangala, Indiranagar, and BTM Layout. These areas benefit from high foot traffic, a younger demographic, and a dense cluster of well-known restaurants. Votes serve as a strong proxy for location-level popularity and competitive intensity.

Figure 9: Customer engagement (votes) aggregated by restaurant location

9. Top Cuisines by Votes

North Indian cuisine dominates total vote counts, followed by South Indian and Chinese. This aligns with the widespread familiarity and preference for these cuisines among Bengaluru's diverse population. 'Others' (consolidated rare cuisines) also commands a significant share, highlighting the city's growing appetite for diverse food experiences.

Suggestions

16. **Expand Online Ordering Adoption:** Restaurants in peripheral Bengaluru locations that have not enabled online ordering should be encouraged by Zomato through targeted onboarding campaigns and subsidised delivery tie-ups. Data shows that online ordering correlates with better ratings, making it a win-win for restaurants and the platform.
17. **Promote Table Booking as a Premium Feature:** Given the strong positive correlation between table-booking availability and higher ratings, Zomato should promote table reservation as a standard feature for mid-range and premium restaurants. Restaurants can leverage this to fill seats during off-peak hours and improve revenue predictability.
18. **Location-Specific Marketing Campaigns:** Locations with lower restaurant density and fewer votes, such as outer ring-road areas, present growth opportunities. Zomato can collaborate with restaurants in these zones through discounts, featured listings, and promotional events to build a stronger customer base.
19. **Focus on Cuisine Diversification:** While North Indian and South Indian cuisines drive the most votes, cuisines from the 'Others' category are growing. Restaurants can attract niche audiences by highlighting unique or underrepresented cuisines. Zomato can support this with themed food festivals or dedicated cuisine discovery pages.
20. **Improve Rating Mechanisms for Delivery-Only Outlets:** Delivery-only restaurants show lower average ratings, possibly due to packaging quality, delivery time, or food temperature issues. Targeted feedback collection and quality improvement programmes can help bridge the rating gap between delivery and dine-out formats.

21. Leverage Votes Data for Personalised Recommendations: High-vote restaurants across popular cuisines and locations can anchor Zomato's recommendation engine. Surfacing these restaurants to new users builds trust, while lower-vote restaurants benefit from increased exposure through algorithmic discovery.
